Overview

The 515 FA03 application pack is an add or subtract flow computer that is tailored specifically for energy measurement. It can perform either addition or subtraction on two frequency inputs or on two analog inputs.

The flow computer is suitable for collecting re-transmitted signals from other flow computers providing a resultant rate and total. The instrument displays the flow rate and total for each channel as well as the result.

The frequency input is compatible with a wide range of frequency signals, including millivolt signals, reed switches, Namur proximity switches and pulse trains via its smart front-panel program selection. The analog input can be scaled and have filtering, non-linear correction and cutoff points applied to the signal.

Calculations

For frequency inputs the calculation of totals are exact as the instrument collects all pulses detected on each channel.

$$\text{channel total} = \text{pulses} / k\text{-factor}$$

The flow rates are derived from an accurately measured frequency:

$$\text{channel flow} = \text{frequency} / k\text{-factor}$$

For analog inputs, to derive the flow rate, the analog input is normalised to a value (A) between 0 and 1.

$$\text{channel flow} = (V_{fmax} - V_{fmin})A + V_{fmin}$$

$$\text{channel total} = \int (\text{channel flow} \cdot \Delta t)$$

The resultant values are then:

$$\begin{aligned} \text{ADD result} &= \text{channel 1} + \text{channel 2} \\ \text{SUB result} &= \text{channel 1} - \text{channel 2} \end{aligned}$$

Displayed Information

The front panel display shows the current values of the input variables and the results of the calculations. A list of the variables for this application and their type (total or rate) is shown at the end of this document.

The instrument can be supplied with a real-time clock for data logging of over 1000 entries of the variables as displayed on the main menu.

Communications

There are two communication ports available as follows:

- RS-232 port
- RS-485 port (optional)

The ports can be used for remote data reading, printouts and for initial application loading of the instrument.

Isolated Outputs

The opto-isolated outputs can re-transmit any main menu variable. The type of output is determined by the nature of the assigned variable. Totals are output as pulses and rates are output as 4-20mA signals. One output is standard, a second output is available as an option.

Relay Outputs

The relay alarms can be assigned to any of the main menu variables of a rate type. The alarms can be fully configured including hysteresis. Two relays are standard with additional two relays available as an option.

Software Configuration

The instrument can be further tailored to suit specific application needs including units of measurement, custom tags, second language or access levels. A distributor can configure these requirements before delivery.

Instrument parameters including units of measurement can be programmed in the field, according to the user access levels assigned to parameters by the distributor.
