Overview

The 515 FP03 application caters for custody transfer measurement of petroleum products. The frequency flow inputs can accept a quadrature signal for ISO 6551 level B pulse security. An analog temperature and/or density input allows for volume correction to reference conditions.

This instrument is compatible with a wide range of flowmeter frequency outputs, including millivolt signals, reed switches, Namur proximity switches and pulse trains via its smart front-panel program selection.

The flow computer displays the net and gross flowrates, resettable and accumulated totals. It can be used to measure a range of crude and refined petroleum fluids including gasoline, jet fuels, heating oils, diesels, lube oils and LPGs.

Calculations

The volume total and flowrate are derived from accurately measured frequency and the number of received pulses.
volume = pulses / k-factor

volume flow = frequency / k-factor

The volume correction calculations are based on the ASTM D1250-04 and API Table 54 standard for the following products:

- Crude Oils
- Lube Oils
- Refined Products
- Light Hydrocarbon Liquids (LPG)

Volume correction for other fluids can be calculated by the following means:

- General Coefficient of Expansion
- Preprogammed User Table

Displayed Information

The front panel display shows the current values of the input variables and the results of the calculations. A list of the variables for this application and their type (total or rate) is shown at the end of this document.

The instrument can be supplied with a real-time clock for data logging of over 1000 entries of the variables as displayed on the main menu.

Communications

There are two communication ports available as follows:

- RS-232 port
- RS-485 port (optional)

The ports can be used for remote data reading, printouts and for initial application loading of the instrument.

Isolated Outputs

The opto-isolated outputs can re-transmit any main menu variable. The type of output is determined by the nature of the assigned variable. Totals are output as pulses and rates are output as 4-20mA signals. One output is standard, a second output is available as an option.

Relay Outputs

The relay alarms can be assigned to any of the main menu variables of a rate type. The alarms can be fully configured including hysteresis. Two relays are standard with additional two relays available as an option.

Software Configuration

The instrument can be further tailored to suit specific application needs including units of measurement, custom tags, second language or access levels. A distributor can configure these requirements before delivery.
Instrument parameters including units of measurement can be programmed in the field, according to the user access levels assigned to parameters by the distributor.

All set-up parameters, totals and logged data are stored in non-volatile memory with at least 30 years retention.

Temperature and Density Input Types

Temperature sensor input(s) can be either PT100, PT500, 4-20mA, 0-5V or 1-5V signals. Density sensor input(s) can be either 4-20mA, 0-5V or 1-5V signals.
