Overview

The 515 SC02 application measures the volume, mass and energy content of steam by using an analog volume flow in conjunction with a temperature and/or pressure input.

A selection of various modes makes it suitable for many steam applications. The flowmeter input signal can be selected as either 0-5V, 1-5V or 4-20 mA. Minimum and maximum points are programmed and non-linear correction points can be used to better reflect the flowmeter's behaviour.

The instrument calculates the mass flow and energy according to the IAPWS Industrial Formulation (1997) for the thermodynamic properties of steam. The equations use the pressure and temperature values to determine the specific volume and the specific enthalpy.

Calculations

The steam energy calculations are based on the IAPWS Industrial Formulation (1997).

Superheated steam regions are:

0°C < t < 800°C	P < 100 MPa
32°F < t < 1472°F	P < 14500 psia
800°C < t < 2000°C	P < 10 MPa
1472°F < t < 3632°F	P < 1450 psia

Saturated steam regions are:

0°C < t < 374°C (critical temperature)
32°F < t < 705°F

P < 22 MPa (critical pressure)
P < 3190 psia

Water region is:

0°C < t < $t_{saturation}$ at system pressure
32°F < t < $t_{saturation}$ at system pressure

Formulas

Mass flow = Volume flow / Specific volume
Energy flow = Mass flow × Net Specific enthalpy

Displayed Information

The front panel display shows the current values of the input variables and the results of the calculations. A list of the variables for this application and their type (total or rate) is shown at the end of this document.

The instrument can be supplied with a real-time clock for data logging of over 1000 entries of the variables as displayed on the main menu.

Communications

There are two communication ports available as follows:

- RS-232 port
- RS-485 port (optional)

The ports can be used for remote data reading, printouts and for initial application loading of the instrument.

Isolated Outputs

The opto-isolated outputs can re-transmit any main menu variable. The type of output is determined by the nature of the assigned variable. Totals are output as pulses and rates are output as 4-20mA signals. One output is standard, a second output is available as an option.

Relay Outputs

The relay alarms can be assigned to any of the main menu variables of a rate type. The alarms can be fully configured including hysteresis. Two relays are standard with additional two relays available as an option.

Software Configuration

The instrument can be further tailored to suit specific application needs including units of measurement, custom tags, second language or access levels. A distributor can configure these requirements before delivery.

Instrument parameters including units of measurement can be programmed in the field, according to the user access levels assigned to parameters by the distributor.

All set-up parameters, totals and logged data are stored in non-volatile memory with at least 30 years retention.

Temperature and Pressure Input Types

Temperature sensor input(s) can be either PT100, PT500, 4-20mA, 0-5V or 1-5V signals. Pressure sensor input(s) can be either 4-20mA, 0-5V or 1-5V signals.
